Dear Dr.

I want to assure you that we are earnestly working toward a meeting on the Sine-Wave Testing Equipment -- as Dick has mentioned in his most recent phone conversations with you. We also, of course, are assuming the responsibility for all delays in your project which might result from the pretraction of our own schedule. Such consequent delays will be properly attributed on our inspection reports so that they will not in the least way affect the final evaluation of your company's performance.

Because of further difficulty in repairing the camera and of the bureaucratic time involved in procuring a new one, Dick has resorted to a graphic back and will consequently put the filters on glass plates. He now anticipates being able to deliver the filters during the week of 15 March.

Enclosed is an outline of the equipment whose optical performance we would like to be able to measure. We have, of necessity, been generic in our listing -- primarily because any more detail would expose the scope of our development program and would therefore require higher classifications. Consequently, we will have to review individual items of equipment with you personally.

The more idiosyncratic systems are of course those currently under development. Some systems are electro-optical in nature -- such as CRT systems and image intensifier systems. Again, I'm afraid we must confine our most helpful discussion of equipment to a private meeting with you at your facilities: I'm sure you can appreciate our predicament. Sometime after our upcoming meeting, why don't you plan to visit Washington and we shall arrange an equipment presentation for you.

We are tentatively planning a trip to on 15 March and will check out and confirm the date with you this week by telephone.

25X1A

Best regards,  
Robin
